What is the purpose of a Data Maturity Assessment?

An data maturity assessment is intended to improve the level of data quality required to meet business goals and objectives. The assessment creates visibility into the current state of data maturity as compared to data management and quality best practices

What is the approach for a Data Maturity Assessment?

Assessment is conducted at an individual attribute/metric level. It focuses on the review and assessment of key documentation and materials used in the current data management practices. It is designed to be an optimized balance of breadth and depth of scope and velocity.

What steps are employed in a data maturity assessment?

- Specify attributes to be evaluated
- Identify equivalent of the attribute in source system
- Determine business governance information available and review
- Identify source system of record
- Determine mechanism of attribute population
- Determine list of reference values
- Interview data quality resources for in-place measurements
- Identify any information management work complete on the attributes

How is the data maturity assessment used?

The data maturity assessment is intended to be reviewed on an ongoing basis by data owners to ensure management practices and documentation are supporting business capabilities

What are the dimensions in a maturity assessment?

There are nine (9) key dimensions used in the maturity assessments:

- Data Governance
 - Definition
 - Value Set or Range (metric)
 - Data Stewardship / Governance
- Data Quality
 - Data Health
 - Quality Plan
 - Value Standard & Control
- Information Management
 - Data Journey
 - Business Process
 - Business Value

What is the criteria and rating?

The maturity assessment rates each of the dimensions based on the following ratings with a score based on a 1-5 range

Dimension	Description	Score
Limited	Dimension is severely limiting the ability of this attribute to meet business requirements (ie. Not capable, ad-hoc, notexisting, no documentation)	1
Emerging	Dimension is meeting basic needs but not effective (ie. Somewhat defined)	2
Effective	Dimension is enabling this attribute to meet business	3

	requirements but not fully optimized across the enterprise (ie. Standardized, documented in .repository, controlled, measured)	
Advanced	Dimension is well governed, fully measured and continually improved to deliver business value (ie. Governance routines, global adoption, continuous improvement)	4
Optimal	Dimension is fully standardized, simplified and scaled across the organization to delivery optimal value (ie. Drive higher performance, sustainable, fully agile, delivering continual value)	5

How are the dimensions and criteria rating assessed?

There are nine (9) key dimensions measured for each attribute:

Category	Process Area	Limited	Emerging	Effective	Advanced	Optimal
Information Management	Data Journey	There is no documentation surrounding how the attribute moves through the various systems	There is rudimentary documentation surrounding how the attribute moves through	There is standardized incomplete documentation surrounding how the attribute moves	There is standardized thorough documentation how the attribute moves through the various systems	There is standardized thorough documentation surrounding how the attribute moves through

			various systems	through various systems		various systems in a central accessible enterprise approved repository
Information Management	Business Process					
Information Management	Business Value					
Data Governance	Attribute Definitions					
Data Governance	Value Set					
Data Governance	Data Stewardship					
Data Quality	Data Health					
Data Quality	Quality Plan					
Data Quality	Value Standard & Control
