Retail Subject Area Model

- Subject area model represents an organization which designs, orders, procures, ships and directly or indirectly sells its products.
- The Retail Subject Area Model is generic in scope, but defines the operations of an organization at a high level. It generally describe how enterprise data is organized and is the basis for how talk about data and its interconnectivity.
- It is lightly maintained with business insight

What is a Subject Area Model (SAM) used for?

Business Project Planning and Communication

- Help resources see how the evolution of systems and data relates to their individual roles and responsibilities
- Used to help describe why the data is necessary to enabling analytical efficiencies

Establishing Data Governance

- Defining how the business oversees the capture, quality and usage of data
- Assign stewardship of data by each subject area
- Identification locations of privacy and security.

Requirements Definition

- High level model that can be used to quickly outline required data components
- Communicate and validate how the data needs of any effort fit into overall data architecture
- Provides basis for the sorting and ordering of source to target mapping efforts

Data Capture or Integration Planning

- Use SAM to logically separate ETL or Data Integration framework
- Provides separation of resources to focus on quality, integration and integrity

Data Model Development

- Basis for building your model a piece at a time, allowing multiple resources to work on parts
- Data modeling team to focus and prioritize the creation of a formal data architecture design

Definition of Subjects

Supplier

Supplier is the overarching subject area for all information involving suppliers of goods and services to . This includes direct and indirect suppliers, profiles, compliance, contracts, and general capabilities and capacities that may be used in long range/high level sourcing

- Direct Supplier Management
- Manufacturing Operations
- Indirect Supplier Management
- Supplier Sustainability
- Supplier Third Party Risk
- Supplier Contract Management

Material

Material is the overarching subject area for data related to materials themselves including both the development to and formal publication of approved materials and supplied materials. Data related to the actual sourcing decisions (supplier selection) is in the subject area.

- Material BOM
- Material Sample
- Material Specification
- Material
- Raw Material
- Supplied Material

Color

Color is the overarching subject area for all data related to Colors from initial development, testing and specification to Color Catalog publication.

- Color Development
- Color
- Color Data

- Color Palette
- Color Trends and Inspiration
- Color Cost
- Color Price
- Supplied Material Cost
- Supplied Material Color

Product

Product is the overarching subject area for product data from Concept to Market

- Product Master
- Product Line
- Product FOB
- Product Bill of Material
- Product Landed Cost
- Product Development
- Product Pricing
- Product Copy and Image
- Product Costing
- Product Content
- Product Assortment

Demand

Demand is the overarching subject area for all information involved in projecting long range, mid-range, pre-season, and in-season customer and consumer demand of products.

- Merchandise Plan
- Location and Store Plan
- Financial Plan
- Demand Plan
 - Retail Sales Value
 - Retail Return Value
 - Wholesale Sales Value
 - Wholesale Return Value
 -
- Assortment Plan

Supply

Supply is the subject area for all information involved in planning for and where needed producing Supply to meet Demand for a given time horizon. This includes sourcing and supply strategies and plans, production orders, and manufacturing, build, and deployment plans.

- Sourcing Strategy
- Materials Plan
- Production Plan
- Purchase Order
- Purchase Order Commitment
- Supply Plan

Inventory

Inventory is the overarching subject area for data related to three distinct views of inventory; planning, physical and logical. Planned Inventory looks to the future and creates forecasts and concrete plans as to the disposition of goods across the global logistic network. Physical inventory knows what is/was physically present at

or between key points in the supply chain (regardless of ownership). Logical inventory knows which segments of real or potential inventory are available to offer consumers or customers. Inventory pertains can be either finished goods or raw materials.

- Available Inventory
- Reserved Inventory
- Contract Inventory
- Physical Inventory
- Inventory Adjustment
- Safety Stock
- Stock Transfer Order
- Planned Inventory

Distribution Center / Node

A Distribution Center is a logistics facility involved in the transfer, storage, and handling of finished goods products. It contains processes and supporting systems that conduct receiving, storing, replenishing, consolidating, and shipping of product. Value added services can take place as well. A Distribution Center related facility can be owned and/or operated by or a 3rd party logistics provider. Synonyms: DC, Hub, Warehouse, Storage Facility, and Transfer Facility

- Demographics
- Capability and Capacity
- Labor
- Facility
- Financial
- Control System

Transportation

Transportation is the business process of planning, executing, and monitoring of efficient, effective delivery of goods from a point of origin (i.e. factory) to a point of destination (i.e. Distribution Center).

- Transportation Network / Node
- Shipment Leg
- Shipment Plan
- Shipment Freight
- Shipment Advance Shipping Notice
- Transport Storage
- Customs and Trade
- Customs Valuation
- Bonded

Order Fulfillment

Order Fulfillment is the overarching subject area that collects data concepts created in the actions of moving an order from capture to fulfillment which is not already contained in the order or delivery objects themselves.

- Delivery Schedule
- Pick-Up Schedule
- Goods Issue
- Goods Receipt
- Node Inbound / Outbound
- Inventory Control

Sales

Sales is the overarching subject area for all actual orders of products and services and the current and historical allocation of supply to those orders. Order can be both internal and external, with variable time windows for order fulfillment.

- Order Allocation
- Consumer Order
- Consumer Return
- Customer Order
- Customer Return
- Customer Contract
- Customer Priority

Finance

Finance, used in this context, is referring to Corporate Finance and therefore the definition is for Corporate Finance. Corporate finance refers to the financial activities related to running a corporation and overseeing these financial activities daily and recording of such and summarizing at certain period of time for reporting to stockholders as well as to local and global government authorities in the country of operation.

- Financial Calendar
- Currency and Exchange
